FEKRA Technical SEO Review

www.fekra-egy.com · 13 October 2026 · Batch 6: Google sitelinks and page structure

> **Goal:** make Google treat **Services, About Us, Blog, Contact Us and Careers** as the main sections of the site, and stop it from showing old pages such as Ecommerce, Media and Education. Google picks sitelinks itself, so nobody can force an exact list. What we can do is send clear signals for the main pages and remove the signals that point to old ones. Each item below covers what we found, where it is set up in the app, and what we changed.

ITEM	RESULT
1. Main navigation structure	OK One decision for FEKRA (see item 1)
2. Internal linking	OK 127 internal links checked, none broken
3. Page titles and meta descriptions	OK Unique for all five main pages, in every language
4. Canonical URLs	Fixed Language links on Services and Careers
5. XML sitemap	Fixed Removed a redirect and four duplicate pages
6. Breadcrumbs	Added Services, Careers, Blog and Contact
7. Structured data	Fixed Organization logo; breadcrumbs added
8. Old and duplicate pages	Fixed Four placeholder service pages retired
9. Redirects from outdated URLs	Fixed 106 checked; two broken ones repaired
10. Old pages to remove or noindex	Fixed Old industry pages now return 410 Gone

1 Main navigation structure

OK

The header menu on every page, in all five languages, is: **Home · Services · About · Blog · Careers · Contact Us · Meet Fika AI**, plus a "Book a 30-Min Call" button. All five main sections are in the menu on every page, which is the strongest signal we can send for sitelinks.

Decision for FEKRA: the top-level *Services* menu item opens `/services/hire-dedicated-developers`, not the `/services` page. This was asked for in Batch 2 so that clicking Services opens the designed landing page. Google still finds `/services` through the sitemap, the breadcrumbs and the Services page's own links. But pointing the menu item at `/services` would make "Services" a stronger sitelink. It is a one-line change if you want it.

CONFIGURATION IN THE APP

Menu items and dropdowns	CMS → **Site** → **Header & Navigation** (`src/payload/globals.ts` , global `header`)
Desktop menu and mega menu	`src/components/layout/Header.tsx` , `ServicesMegaMenu.tsx`
Mobile menu	`src/components/layout/MobileNav.tsx`
Where the Services link points	`src/lib/resolveLink.ts:45`

2 Internal linking

OK

We collected every internal link on the home page, the five main pages, the Arabic home page and a service page. That was **127 unique URLs**, and every one returned 200, with no broken links and no redirect chains. Each main page is linked from the header on every page. The Services page links to every service, the Blog page to every post, and the Careers page to every open role.

The footer links only to the legal pages. Adding a short "Company" column (Services, About, Blog, Careers, Contact) would add one more site-wide link to the main pages. It is optional because the header already does this.

CONFIGURATION IN THE APP

Footer columns and legal links	CMS → **Site** → **Footer** (global `footer`) · `src/components/layout/Footer.tsx`
Services page (links every service)	`src/app/(site)/[locale]/services/page.tsx`
Broken-link check script	`pnpm check:links` (`scripts/check-links.mjs`)

3 Page titles and meta descriptions

OK

PAGE	TITLE	DESCRIPTION
Home	Fekra Tech	Software Outsourcing & Dedicated Teams	Build your team with Fekra Tech. We provide software outsourcing and dedicated developers…
/services	Services	Fekra Tech	Explore our technology services and solutions.
/about	About Us	Fekra Tech	Meet Fekra Tech and learn about our team.
/blog	Blog	Fekra Tech	Insights, company news and technology updates.
/contact	Contact Us	Fekra Tech	Talk to us about your team and project requirements.
/careers	Careers	Fekra Tech	Explore opportunities to join Fekra Tech.

These match the approved reference wording for the sitelinks. Every service page, blog post and job has its own unique title and description. Arabic, German, French and Spanish have their own translations.

CONFIGURATION IN THE APP

Main-page titles and descriptions (all languages)	`src/i18n/qa-copy.ts` → `sitelinkCopy`
Home page title	`src/app/(site)/[locale]/page.tsx`
Service, blog, job and other pages	CMS → each document → **SEO** tab (meta title and description, `@payloadcms/plugin-seo`, `src/payload.config.ts:265`)
Shared builder (title, description, Open Graph)	`src/lib/seo.ts` → `buildMetadata()`

4 Canonical URLs and language versions

Fixed

Every page has one canonical URL that points to itself. All duplicate forms of a URL redirect to that one version in a single 308 step:

- `http://` → `https://`, and `fekra-egy.com` → `www.fekra-egy.com`
- `/en/about` → `/about`, because English pages have no language prefix
- `/about/` → `/about` (trailing slash removed)
- Tracking links such as `?utm_source=…` keep the clean canonical URL

Fixed: `/services` and `/careers` told Google they existed only in English, even though `/ar/services`, `/de/careers` and the other language versions exist and are in the sitemap. That mismatch makes Google ignore the language links. Both pages now list all five languages plus `x-default`, the same as Home, About, Blog and Contact.

CONFIGURATION IN THE APP

Canonical and language links	`src/lib/seo.ts` → `buildMetadata()` (`alternates.canonical` and `languages`)
Per-document canonical override	CMS → document → SEO tab → **Canonical override**
/en removal and language routing	`src/proxy.ts`
HTTPS and www redirect	Vercel project → Domains (`fekra-egy.com` redirects to `www`)
This fix	`services/page.tsx` and `careers/page.tsx` now pass `availableLocales: [...LOCALES]`

5 XML sitemap

Fixed

We checked all 67 URLs in the live `/sitemap.xml`. 66 returned 200, pointed their canonical at themselves and were indexable. The sitemap also points to `robots.txt` and lists the language versions of each page.

- **Removed** `/meeting`**.** It only redirects to Calendly, and a sitemap should list only pages that load directly.
- **Removed the four duplicate placeholder service pages** (see item 8).
- **Added a safety rule:** any URL listed in `redirects.json` is now left out of the sitemap automatically, so a page that redirects can never be listed by mistake.

The sitemap now has 62 URLs. Closed jobs, pages marked noindex and pages marked "Hide from sitemap" are excluded automatically.

CONFIGURATION IN THE APP

Sitemap generator (refreshes hourly)	`src/app/sitemap.ts`
Hide one page from the sitemap	CMS → Pages → **Hide from sitemap** (`src/payload/collections/Pages.ts`)
Redirected-URL filter	`src/lib/redirects.ts` → `redirectsAway()`
robots.txt (points to the sitemap)	`src/app/robots.ts`

6 Breadcrumbs

Added

Service pages, blog posts, job pages, About, the legal pages and Fika already had breadcrumb data (`BreadcrumbList`). The four main listing pages had none. They now include **Home › Services**, **Home › Careers**, **Home › Blog** and **Home › Contact Us**, translated in every language (for example الرئيسية › الخدمات in Arabic). This tells Google these pages sit directly under the home page.

CONFIGURATION IN THE APP

Breadcrumb builder	`src/lib/jsonld.ts` → `breadcrumbSchema()`
Added on	`services/page.tsx` , `careers/page.tsx` , `blog/page.tsx` , `contact/page.tsx`
Already present on	`[slug]/page.tsx` , `services/[slug]` , `blog/[slug]` , `careers/[slug]`
Labels	Dictionary `nav.home` , `nav.services` and so on, in `src/i18n/dictionaries/*.json`

7 Structured data

Fixed

TYPE	WHERE
Organization (name "Fekra Tech", logo, social profiles, contact details)	Every page
WebSite (site name "Fekra Tech" and alternate names, including Arabic)	Every page
BreadcrumbList	All pages except Home (see item 6)
Service · FAQPage	Service pages · Home, About and service pages
JobPosting · Article	Job pages · Blog posts

Fixed: the Organization logo pointed to an old image on an external storage host. It now points to `https://www.fekra-egy.com/icon-512.png` , a square 512 px image on our own domain that matches the favicon. That is the format Google asks for.

For FEKRA to update in the CMS: the headquarters address in the site data is "Cairo, Egypt", but the Google Business Profile says "6 Al Dokki St, Dokki, Giza". Making them match helps Google connect the website to the business listing.

CONFIGURATION IN THE APP

All structured-data builders	`src/lib/jsonld.ts`
Organization and WebSite output	`src/app/(site)/[locale]/layout.tsx`
Social profiles, offices, address	CMS → **Site** → **Site Settings** (global `site-settings`)
Favicon and logo files	`src/app/favicon.ico` , `icon.svg` , `apple-icon.png` , `public/icon-192.png` , `public/icon-512.png`

8 Old and duplicate pages

Fixed

- **Duplicate URL versions** (http, non-www, /en, trailing slash) all redirect to one version (see item 4).
- **Four placeholder service pages** from the original setup were still live, in the sitemap, and shown as the first four cards on the Services page. They had almost no content and duplicated the real service pages. Each now redirects permanently (301) to its real page and has been removed from the Services page and the sitemap:

OLD (THIN)	NOW REDIRECTS TO
`/services/ai-engineers`	`/services/hire-ai-data-experts`
`/services/software-developers`	`/services/hire-full-stack-developers`
`/services/qa-engineers`	`/services/hire-qa-engineers`
`/services/devops-cloud`	`/services/hire-devops-cloud-engineers`

We recommend unpublishing or deleting these four documents in CMS → Services so editors don't use them by mistake. The redirects work either way.

CONFIGURATION IN THE APP

Redirect list	`redirects.json` (loaded by `next.config.ts` → `redirects()`)
Hide redirected services on the Services page	`src/app/(site)/[locale]/services/page.tsx` (`redirectsAway`)

9 Redirects from outdated URLs

Fixed

`redirects.json` holds 106 permanent redirects from the old WordPress site. These include the old service URLs (for example `/reactjs-development` → `/services/hire-react-developers`), old blog posts, `/career/*` → `/careers/*`, `/contact-us` → `/contact` and `/news` → `/about`. We tested all 100 fixed URLs (the other 6 are pattern rules) on the live site. Each goes to its destination in a single step.

- **Fixed:** `/career/full-stack-engineer` and `/career/senior-mobile-engineer-react-native` pointed to jobs that no longer exist, so visitors landed on a 404. Both now go to `/careers`.
- We also checked the full list of the old site's URLs from the Internet Archive (215 URLs). Every real content page is now handled. The only remaining 404s are WordPress internals (`/elementskit-content/…`, `/jet-menu/…`, `/author/…`, `/hello-world`). A 404 is the right answer for those.

CONFIGURATION IN THE APP

Redirect list (one step each, built into the routes)	`redirects.json` → `next.config.ts` `redirects()`
Redirect checker	`pnpm check:links`

10 Old pages: removed or noindex

Fixed

Google's current sitelinks *Ecommerce*, *Media* and *Transforming Education System* come from the old WordPress industry pages. These pages used to redirect to the home page. Google treats a redirect to the home page as a "soft 404" and can keep showing the old title for months.

Changed: these URLs now return **410 Gone**, which tells Google the page was removed on purpose. This is the fastest way to get them dropped from the index. The 410 page is also marked `noindex` and shows the FEKRA "page not found" design, with a link back to the home page.

Covered: `/ecommerce`, `/media`, `/education`, `/agritech`, `/finance`, `/food`, `/games`, `/healthcare`, `/insurance`, `/real-estate`, `/sports`, `/logistics`, `/ev-charging`, `/ev-charging-2`, and everything under `/ind/*` and `/industriess/*`.

Other pages that stay out of search: the CMS (`/admin`, `/cms-api`) and `/api` are blocked in `robots.txt` and marked noindex. Closed jobs are noindex. Any CMS document can be set to noindex from its SEO tab.

CONFIGURATION IN THE APP

Retired-page list (410)	`src/proxy.ts` → `RETIRED`
Noindex a single page	CMS → document → SEO tab → **noindex**
Blocked paths and AI crawler policy	`src/app/robots.ts` · CMS → Site Settings → Crawler policy
Noindex headers for the CMS	`vercel.json` → `headers`

Next steps in Google Search Console

- **Sitemaps:** resubmit `https://www.fekra-egy.com/sitemap.xml`.
- **URL Inspection** → **Request indexing** for `/`, `/services`, `/about`, `/blog`, `/contact` and `/careers`. Re-indexing the home page also refreshes the favicon shown in search.
- **Removals** → **New request** for `/ecommerce`, `/media` and `/education`. This hides them right away while the 410 status removes them for good.
- Check back in 2–4 weeks. Sitelinks and the favicon update only after Google recrawls the pages.

Open decisions for FEKRA

- Should the header's *Services* item open `/services` instead of the Hire Dedicated Developers page? It would give a stronger "Services" sitelink (item 1).
- Add a "Company" link column to the footer? Optional (item 2).
- Update the headquarters address in Site Settings to match the Google Business Profile (item 7).
- Unpublish the four placeholder service documents in the CMS (item 8).

Changes shipped in this batch

COMMIT	CHANGE
`0660db6`	Old industry pages return 410; the Organization logo now points to the on-domain icon
`48f9796`	FEKRA favicon on the CMS admin and on the 404/410 pages
`134ee69`	Language links and breadcrumbs on the main pages, sitemap cleanup, duplicate services retired, broken job redirects fixed

Checked against the live site and a local build on 13 Oct 2026. URL counts come from the live sitemap and from `redirects.json`.
