FEKRA Website — Quick Handover

22 Oct 2026

What it is

FEKRA's marketing site at **https://www.fekra-egy.com**. One Next.js 16 app with Payload CMS 3 built in. 5 languages (en, ar, de, fr, es), light/dark mode, blog, services, careers with CV upload, contact and booking.

Piece	Where
Code	github.com/fekra-eg/fekra (default branch `master`)
Hosting	Vercel project `fekra`, region `fra1`
Database	Supabase Postgres (`eu-north-1`)
Media + CVs	Supabase Storage bucket `fekra_assets` (private; CV links are signed and expire in 5 min)
Email	Resend · Bot check: Cloudflare Turnstile · Analytics: GA4 `G-C39M5MW6D8`, loads only after consent
CMS admin	`/admin` (API at `/cms-api`). Admin login: **admin@fekra.com** · password: `Mo@064644878`
AI translation	OpenAI API key (`OPENAI_API_KEY` in Vercel) powers the "Translate to all languages" button on blog articles

Accounts: every platform above (GitHub, Vercel, Supabase, Resend, Cloudflare, Google Analytics / Search Console, OpenAI) is signed in with **ahmed.developer@fekra-egy.com**. Exception: Calendly (`fekra-egy-info/30min`) is on FEKRA's own account, not this one. Passwords are not stored in this repo; get them from the account owner.

Run it locally

```
cp .env.example .env.local   # set DATABASE_URL and PAYLOAD_SECRET at minimum
docker compose up -d db
pnpm install && pnpm dev     # site: localhost:3000 · admin: /admin
pnpm seed                    # optional starter content
```

Every env var is documented in `.env.example`. Real values live only in Vercel.

Where things live

- `src/app/(site)/[locale]/`: public pages. English has no prefix (`/about`); other languages do (`/ar/about`).
- `src/payload/`: CMS collections, globals, page-builder blocks, publish hooks that refresh cached pages.
- `src/components/blocks/`: one renderer per CMS block.
- `src/i18n/routing.ts`: all locale and URL rules. `src/proxy.ts`: locale routing and noindex.
- `redirects.json`: old WordPress URL to new URL map.
- `scripts/`: seed, translation, fix and check scripts (`pnpm check:i18n`, `check:links`, `perf`, `check:storage`).

Deploy and roll back

- `pnpm build` runs DB migrations first (`scripts/migrate.mjs`), then builds.
- Push to the Vercel production branch to deploy. Each PR gets a preview, which is never indexed. ⚠️ `vercel.json` lists `main` under `git.deploymentEnabled`, but the default branch is `master`. Check which branch production follows in Vercel → Settings → Git.
- **Rollback:** Vercel → Deployments → last good build → *Promote to Production*.

- **Schema change:** `pnpm migrate:create <name>`, commit the migration, then `pnpm generate:types`.

Editing content (for FEKRA)

Save Draft → Preview → Publish. Publishing refreshes the live page within seconds. Switch language at the top of the edit screen. Set **Available locales** on each document; only listed languages appear in the language switcher and hreflang.

Still open (from the register, 14 Oct; re-check before relying on it)

#	Item	Owner
S-01	✅ Audit down from 63 to 2 after the upgrade and overrides. The 2 left (`braces` in the admin Sass watcher, `esbuild` dev server) have no upstream fix and don't run on the public site	Dev
S-02	✅ Fixed: live pages are CDN-cached (`x-vercel-cache: HIT`, checked 22 Oct)	Dev
S-03	Re-run mobile Lighthouse now that caching works	Dev
S-05	End-to-end test on production: contact, careers (CV email), Calendly	Dev + FEKRA
S-06	**Transfer ownership** (GitHub, Vercel, domain/DNS, Supabase, Resend, GA4, Search Console, CMS admin)	Dev + FEKRA
S-07	Browser and device test pass	QA
S-09/10	Branch protection; uptime monitor on `/api/health`	Dev
S-08/11/12	Content decisions, office addresses, LinkedIn Partner ID	FEKRA

Gotchas

- The default seed admin is `admin@fekra-egy.com` / `ChangeMe123!`. Make sure it is changed or removed in production.
- If `S3_BUCKET` is empty, uploads go to local disk, and Vercel wipes that disk on every deploy.
- `S3_REGION` must be the real region (`eu-north-1`), never `auto`.
- Without `NEXT_PUBLIC_ENV=production`, the site is set to noindex (intended for previews).
- Rotating `PAYLOAD_SECRET` logs out every CMS user.
- Health check: `GET /api/health` returns 200 only when the database responds.
